Java Frinsa Estate - Producer Profile

Introduction

Java Frinsa Estate is a specialty coffee producer based in the Bandung Highlands of West Java, Indonesia. The estate is owned by Wildan Mustofa and Atieq Mustikaningtyas, with Wildan overseeing farming and processing operations and Atieq managing human resources and finance. Today, their son Fikri Mustofa is stepping into a leading operational role, ensuring continuity of the family project and carrying the estate into its next generation.

Frinsa was established in 2012 in direct response to recurring landslides and flooding in the highland regions of West Java. These issues were closely tied to deforestation and poor agricultural practices on steep terrain. The founders set out to build a coffee operation that could deliver world-class quality while restoring environmental stability and creating a viable long-term model for the region.

Growing Areas & The Frinsa Collective

The estate spans multiple growing zones across West Java, including Weninggalih, Mekarwangi, Tilu Mountain, Pengalengan, Malabar Mountain, and Garut, with total planted areas across estate-owned land and partner plots. Cultivars grown include Typica, Sigararutang, Lini S795, Andungsari, Borbor, Timtim, P88, Ateng Super, Blue Mountain, and others.

Growing Areas & The Frinsa Collective...

In addition to estate production, Frinsa works with selected smallholder farmers and outgrowers, collecting and processing cherries under direct Frinsa supervision. These coffees are marketed as Frinsa Collective, extending Frinsa's standards of agronomy, post-harvest control, and traceability beyond their own land while providing better market access and price stability for partner farmers.

Environmental Practices

Sustainability at Frinsa is foundational and operational:

- Coffee trees are grown primarily under shade, including Lamtoro, avocado, jackfruit, and native forest species
- Shade tree root systems stabilize slopes and reduce soil erosion
- Fallen leaves are left as natural mulch to rebuild soil nutrients
- Wastewater is treated through bioremediation systems, then reused or safely released
- Coffee pulp is composted into organic fertilizer, eliminating chemical inputs
- Mucilage is collected and processed into cascara, ensuring full use of the harvest

Forest disturbance is kept to an absolute minimum, allowing surrounding ecosystems to regenerate and directly contribute to long-term farm health and cup quality.

Impact & Transparency

Java Frinsa Estate combines family continuity, environmental responsibility, and technical excellence. The project is fully transparent at every stage, and the Frinsa team actively trains neighboring farms in sustainable land use and quality-focused processing. Under the next generation's leadership, Frinsa continues to refine and expand what is widely regarded as the most technically advanced and consistently high-quality coffee production in Indonesia.

Java Frinsa Estate represents a modern Indonesian coffee model: controlled, traceable, environmentally grounded, and built to outperform—not just participate—in the global specialty market.

Thank you for choosing to work with us!

Your support strengthens the partnership between Across Indonesian Seas and Java Frinsa Estate, helping sustain long-term family farming, responsible land use, and consistently high-quality Indonesian coffee.
